*Sodium compounds, *Luminescence, Crystals,
Lattices.

Improved measurements of the decay law and of the
temperature dependence of the decay time and lumines-
cent yield were made for two types of scintillations in
pure CsI and NaI. The results show that the one type
is described by a relatively simple model and may be
explained, as already suggested for NaI, as the re-
combination of degenerated excitons, self-trapped in
the crystal lattice. The other type of scintillations,
